

Installation of replacement spring tanks In VanAmps reverb pedals

Unscrew the six screws holding the back cover and remove. Snip the wire tie on top of the tank and remove the cables from the jacks on the reverb tank. Stand the unit on the end opposite the power jack. Using an 11/32" wrench to hold the nuts, unscrew the four screws securing the tank to the chassis and remove the tank. Replace the tank with the RCA jacks facing the pots, ensuring that the solder lug is sandwiched between the chassis and the flange of the tank. Tighten screws in a crosswise manner, and readjust once tight for any twisting of the chassis. Thread a new zip tie through the tie mount, *plug the reverb plugs into the new tank, crisscross the reverb cables over the wire mount and tighten the zip tie. Snip off excess tie. Re install the bottom cover, making sure not to over-tighten the screws.

*****NOTE*****

*The Red Plug goes to the output jack and the Black Plug goes to the input jack
